Theritate and fundicrobial gents active against organisms such as bacteria and fundicrobial agents active against organisms such as bacteria and fundi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fundions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fundi. The entimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fundi. The estore efficacy of conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in functions of leukocytes, as disinfectants or preservatives for use in commerces and cosmetics and as agents to improve efficiency of molecular blology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short of spectrum activity against pathogens exhibiting multiple antibiotic are based upon natural antimicrobial peptides to the present invention are based upon natural antimicrobial peptides to the present and broad overcome problems of toxicity, immunogenicity, and shortness of duration. The present estimicrobial peptides the resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration. Of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit pwp based antimicrobial peptide
                                        truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also
                                                                                                                included are (1) an antimicrobial peptide composition for direct activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial peptides for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

ö
             corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting selected from XZBAZBASB, BXZXXB, XBBXZBBS and its derivatives selected from XZBAZBASB, BXZXXB, XBBXZBBS and BBXZBBXZ; and baccod from XZBAZBASB, BXZXXB, XBBXZBBX and BBXZBBXZ; and (b) a second peptide template XBBXX and their derivatives selected from the XBBXXXBBXXBBX; where B = at least one positively charged amino acid, x = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acid, and where B, X and z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AMYS7463 to AAYS7557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XEBENEXBB and alts derivatives as second peptide template XEBXX where ABXZEBAS, webscaped from the group consisting of XEBXEBS, XEBXXEBS, WEBXZEBS, and (b) a second peptide template XEBXX and their derivatives selected from the group consisting of XEBXEBS, XEBXXEBS, BXXEXS, WEBZXEBS, and (b) at least one positively charged amino acid, x at least one aromatic amino acid, and where B, X and Z may be separated by one or more other
                                                                                                                                                                                                                                                                                                                                                                                                                              Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial peptides for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAX57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungacide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antimicrobial peptide composition for use

The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents acrowe against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                               overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                    .;

Antimicrobial peptides for potentiating antimicrobial agents active

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against conganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XEBERENEB and its derivatives a selected from XEBERENES, BXZXZB, BXZXZBB, WEBXZXBBS, and (b) a second peptide template XEBXX and their derivatives selected from the group consisting of XEBXEBS, XEBXXBB, BXXEBS, XEBXXBB, and (b) as second peptide template XEBXXBBS, BXXBXSB, MENCES, where B = at least one positively charged amino acid, x = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other

```
ö
amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7463 to AAYS7557 represent sequences used in the exemplification of the present invention

ఠ New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.

Disclosure; Page 129; 221pp; English.

distributions are particular properties of State or and Fundio compositions of State or against organisms such as bacteria and fundi compositions of State or and PMP-2, platelet microbiocidal protein), and retromers from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers The truncations, extensions, combinations, funding and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as or for potentiating antimicrobial agents active against organisms such as antimicrobial peptides of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fundions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fundi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other specifically against that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial for leukocytes, as disinfectants or preservatives for use in The invention relates to an antimicrobial peptide composition for use

foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                            Gaps

The invention relates to an antimicrobial peptide composition of the invention relates to an antimicrobial peptide composition of the invention relates to an antimicrobial protein), and retroners, the ind PMP-1, platelet microbiocidal protein), and retroners, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (i) an antimicrobial peptide composition for direct activity or or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retroners, extensions, combinations and fungions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual activity of leukocytes against organisms such as bacteria and fungi. The attimicrobials agents that enhance, potentiate or restore efficacy of antimicrobials, agents that enhance the antimicrobial committions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable operiodes of prior art have generally been considered to have undesirable the present invention are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antimicrobial peptide composition for use

```

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXB, XBBXZXBBX and BWZZBBXZ; and (b) a second peptide template XBBXXBX, BXBXXBBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXXBB, and CXBZXXBBXZBBX; where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AMY57463 to AAY5757 represent sequences used in the exemplification of the present invention

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZEMENS and its derivatives selected from XZBZEMENS, BXZXZB, XBBZXZBBX and BBXZBBXZ; and (b) a second peptide template XBBXXXB, XBBXZKBBX and backering of XBBXZBBX; Where B = at least one positively charged amino acid; X = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of infections.
spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neurrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAV57463 to AAV57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-10 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbicidal protein), and retromers.

Eventuations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are to 1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as acteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and funsions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi, agents in combination with other, appending antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial and companied and as agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in the conventions and comments and as agents to improve efficiency of molecular and comments and as agents to improve faritation of proversely.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ĕ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                     Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection; fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                                                                                                                                                                          Rabbit platelet microbicidal protein, PMP-2, based peptide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (HARB-) HARBOR-UCLA RES & EDUCATION INST.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 128; 221pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XCBBZBXBXB, BXZXXB, XBBXZXBB, and BMXZBBXZ, and (b) a second peptide template XBBXXXB, XBBXXXBB, and their derivatives selected from the group consisting of XBBXBBX, XBBXXXBB, BXXXBB, and and consisting of XBBXBBX, XBBXXXBB, BXXBXXB, AXBBXXBB, and activatives one non-polar hydrophobic amino acid, 2 = ar least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AMX57463 to AAX5757 represent sequences

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-10 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and recromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 contendining an amino acid core sequence selected from truncations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The attimicrobial peptides are useful as individual antimicrobial agents, agents that enhance the antimicrobial antimicrobials, agents that enhance the antimicrobial for conventional antimicrobials, agents that enhance the antimicrobial for conventional antimicrobials, agents to improve efficiency of conventional antimicrobials, agents to improve efficiency of mortions of leukocytes, as disinfectants or preservatives for use in conventional antimicrobials. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short
New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                 Example; Page 72; 221pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 18 AA;

The present sequence is an antibacterial peptide C18G, which was modified by adding a Cys-amide to the carboxy terminus. This was used to produce an immunoadapter conjugate. Making a conjugate comprises covalently.

Inking a surface-binding ligand (SBL) to a hapten via a spacer to form a ligand-spacer-hapten (LSH) compound, and reacting the compound with munoadapter of the Igand-spacer-hapten of the compound. The conjugate can be used for the ig to the hapten of the compound. The conjugate can be used for the diagnosis, prevention and treatment of microbial infections, e.g. sepsis, influenza, viremia or fungemia. They can also be used in neurology, cancer and endocrinology, where Ig targeting can provide desired therapeutic effects. The methods for producing a conjugate can use small molecule targeting ligands to efficiently direct otherwise unreactive Ig to microbial targets. This targeting allows Ig to react with microbial structures that may not normally be accessible to Ig, or are incapable of stimulating antibody production
                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial compans. for diagnosis and therapy - comprising microbial surface binding ligand-spacer-hapten, non-covalently associated with immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is a specific example of a cationic oligopeptide suitable for use in compositions with beta-lactam antibiotics. The peptide has an alphabilation structure and is believed to act as an ionophore, making holes in bacterial cell membranes. The peptide and antibiotic act synergistically. See AAR13924-R13930 and AAR13936-7. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compsns. for treating infections sensitive to beta-lactam antibiotics - comprise beta-lactam antibiotic and cationic oligopeptide, useful against Enterobacteriaceae, Pseudomonas aeruginosa etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antimicrobial; immunoglobulin; surface binding ligand; hapten; sepsis; influenza; viremia; fungemia; neurology; cancer; endocrinology;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting cessentially of a first peptide template XZBZBXXBX and its derivatives selected from XZBZBXZBX. BXXXZBX XBBXXBBX and BBXZBBXZ, and (b) a second peptide template XBBXX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, XBBXXBBX, XBBXXBBX, ABBXXBBX, ABBXXBBX, ABBXXBBX, ABBXXBBX, BXXBXXB, ABBXXBBX, and (b) a least one non-polar hydrophobic amino acid, Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other camino acid, and where B, X and Z may be separated by one or more other amino acid, and where B, and Z may be separated by one or more other controphils. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7537 to AAX57537 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Therapeutic formulation comprising N-(phenylalanyl)-4-aminophenyl-alpha-D-mannopyranoside or its cysteinyl derivative useful for diagnosing and

(phenylalanyl)-4-aninophenyl-alpha-mannopyranoside (I). Also described is a method of treatment for bacterial disease comprising: (a) providing a method of treatment for bacterial disease comprising: (a) providing can subject with symptoms of bacterial disease comprising: (a) providing can propounds comportising a mannose of an anomeric configuration, an alpha-aromatic or heteroaromatic ring attached to the mannose by a alycosidic or pseudoglycosidic linkage and a functional group which provides a site for chemical modification remote from the mannose and provides a site for chemical modification remote from the mannose and characteristic and (b) administration of one or more finbriae-binding compounds can be used for treating subjects with symptoms of and for subjects at risk from bacterial diseases. Treatment of and prevention of blood-borne and toxin mediated diseases in particular sepsis in humans and other animals can be carried out and the in vivo neutralisation of the identify bacteria according to their cell binding specificity's through conjugation to reporter substances such as dyes, luminescent or fluorescent molecules and enzymes. The compounds also inhibit the agglutination of yeast cells induced by type I pili bearing bacteria. The present sequence is used in the exemplification of the present invention
                                                                              invention describes a therapeutic formulation comprising N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection, fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.

Example; Page 72; 221pp; English

ò

The invention relates to an antimicrobial peptide composition for the invention relates to an antimicrobial peptide composition for the invention relates to an antimicrobial period core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derived from 150 amino acids containing a 7-13 amino acid core sequence (derived from possible structures are fully described in the specification. Also core for potentiating antimicrobial peptide composition for direct activity or included are (1) an antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions, and (2) antimicrobial peptides are useful as individual activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that chhance, potentiate or restore efficacy of conventional antimicrobials, agents that chance, preservatives for use in foods and cosmetics and as agents that enhance the antimicrobial peptides of prior art have generally considered to have undesirable toxicity, immunogenicity and short belongy techniques. Antimicrobial peptides of prior art have generally considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present and broad are based upon natural antimicrobial peptides that have potent and broad appertance and activity against pathogens exhibiting multiple antibiotic and are perior art have generally considered. resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradelion, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide Antimicrobial; immunoglobulin; surface binding ligand; hapten; sepsis; influenza; viremia; fungemia; neurology; cancer; endocrinology; antibodiotic; antibody; antibiotic. ö antimicrobial peptide composition Pugh C, Score 43; DB 5; Length 18; Pred. ```
The present sequence is a peptide designated C19G. This was used to produce an immunoadapter conjugate. Making a conjugate comprises covalently linking a surface-binding ligand (SBL) to a hapten via a spacer to form a ligand-spacer-hapten (LSH) compound, and reacting the compound with immunoglobulin (Ig) under conditions that allow for non-covalent binding of the Ig to the hapten of the compound. The conjugate can be used for the diagnosis, prevention and treatment of microbial infections, e.g. sepsis, influenza, viremia or fungemia. They can also be used in neurology, cancer and endocrinology, where Ig targeting can provide desired therapeutic effects. The methods for producing a conjugate can use small molecule targeting ligands to efficiently direct otherwise unreactive Ig to microbial targets. This targeting allows Ig to react with microbial structures that may not normally be accessible to Ig, or are incapable of stimulating antibody production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Therapeutic formulation comprising N-(phenylalanyl)-4-aminophenyl-alpha-D-mannopyranoside or its cysteinyl derivative useful for diagnosing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a therapeutic formulation comprising N-(phenylalanyl)-4-aminophenyl-alpha-D-mannopyranoside (I). Also described is a method of treatment for bacterial disease comprising: (a) providing
                                                                                           Antimicrobial compans. for diagnosis and therapy - comprising microbial surface binding ligand-spacer-hapten, non-covalently associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Limulus antilipopolysaccharide factor; LALF; diagnosis; endotoxin;
bacterial infection; antibacterial; fimbriae-binding compound; sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

binding compounds comprising a mannose of an anomeric configuration, an alpha-aromatic or heteroaromatic ring attached to the mannose by a alpha-aromatic or heteroaromatic ring attached to the mannose by a glycosidic or pseudoglycosidic linkage and a functional group which provides a site for chemical modification remote from the mannose and a pharmaceutically carrier; and (b) administering the fimbriae-binding compound to the subject. Administration of one or more fimbriae-binding compounds can be used for treating subjects with symptoms of and for subjects at risk from bacterial diseases. Treatment of and prevention of blood-borne and toxin mediated diseases in particular sepsis in humans and other animals can be carried out and the in vivo neutralisation of the effects of endotoxin is also possible. The compounds may also be used to identify bacteria according to their cell binding specificity's to identify bacteria according to their cell binding specificity's through conjugation to reporter substances such as dyes, luminescent or fluorescent molecules and enzymes. The compounds also inhibit the agglutination of yeast cells induced by type 1 pili bearing bacteria. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, MEXZXBX, KBBXZBBX and BBXZBBXZ; and (b) a second peptide template XZBXZB, KBBXZXBS and BBXZBBXZ; and (b) group consisting of XBBXZBBX, MEXEBXXB, XBBZXXBB, and XBBZXXBBX, Where B = at least one positively charged amino acid; X =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbicidal protein), and recromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid ore sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents. Specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of
                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            οĘ
  at least one aromatic
                amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. ANYS7463 to AAXS7557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting

```
conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cometries and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

Patent No. 6743769;
GENERAL INFORMATION:
APPLICANT: Yeaman, Michael R.
APPLICANT: Shean, Alexander J.
TITLE OF INVENTION: Antimicrobial Peptides and Derived
TITLE OF INVENTION: Metapeptides
FILE REFERENCE: 66742-025(HRS644)
CURRENT APPLICATION NUMBER: US/09/525,269A
CURRENT FILING DATE: 2000-03-13
FRIOR APPLICATION NUMBER: US 09/025,319
FRIOR PEDICATION NUMBER: US 09/025,319
FRIOR PEDICATION NUMBER: US 09/025,319
SOFTWARE: FRASESEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7, Application US/08233203

Patent No. 5409898

GENERAL INFORMATION:
APPLICANT: Darveau, Richard P.
APPLICANT: Blake, James J.
APPLICANT: Cosand, Wesley L.
TITLE OF INVENTION: COMPOSITONS AND METHODS FOR TREATING
TITLE OF INVENTION: INFECTIONS CAUSED BY ORGANISM SENSITIVE TO BETA-LACTAM
TITLE OF INVENTION: ANTIBIOTICS
NUMBER OF SEQUENCES: 12
                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
; OTHER INFORMATION: Antimicrobiocidal peptide designed in part upon interpretation: microbiocidal domains from platelet microbial corner information: proteins 1 and 2 (PMP-1 and PMP-2) from rabbits US-09-525-269A-5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    OTHER INFORMATION: Antimicrobiocidal peptide designed in part upon interpretation microbiocidal domains from platelet microbial Transformation: proteins 1 and 2 (PMP-1 and PMP-2) from rabbits US-09-525-269A-4

Sequence 23756, Application US/09248796A

Patent No. 6747137

GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICANS

TITLE OF INVENTION: NUMBER: US/09/248,796A

CURRENT APPLICATION NUMBER: US 60/074,725

PRIOR PAPLICATION NUMBER: US 60/074,725

PRIOR PAPLICATION NUMBER: US 60/096,409

PRIOR PILING DATE: 1998-02-13

PRIOR PILING DATE: 1998-08-13

NUMBER OF SEQ ID NOS: 28208

SEQ ID NO 23756

LIENGTH: 60
